Designing active substations for the integration of distributed generation into Afghanistan's grid, focusing on energy infrastructure and grid efficiency.

Although the government had planned to invest in a central grid system, high expenses and mountainous terrain of the country are obstacles. The current transmission system is fragmented and ...

Afghanistan's electricity demand is estimated at 2,500-3,000 MW, yet only about 25% is met by domestic generation. The rest is imported from Uzbekistan, Turkmenistan, and Iran. ...

This paper makes a comparative study on the system stability of constant speed wind turbine (CSWT) and the doubly-fed induction generator (DFIG) after grid-connected. Firstly, we present the dynamic ...

This article's goal is to investigate Afghanistan's wind, solar, and hydropower resources.

Grid-based electricity currently reaches only 30-35% of the population, with access concentrated in urban centres such as Kabul, Herat and Mazar-e-Sharif. Rural areas remain largely underserved, ...

A possible adaptation measure for the energy system is represented by transitioning toward more resilient power generation and transmission models, such as a decentralized power system, and the ...

The importance of renewable energy sources has increased rapidly in recent years. Among these renewable energy sources, wind energy comes to leading due to its

Installing wind turbine farms in Herat could provide electricity to most of western Afghanistan. Smaller projects are wind pumps that already have been attached ...
